

Case Study: Time and Attendance Validation (National Department Store)

The Challenge:

Comparing time cards to login times became a task that was repetitive and time consuming for the staff. An automated solution was needed to validate timecard values that fall within acceptable ranges, given date/time values from timecards and logins.

Solution:

Our digital workers extract timecard data and generates a formatted report that is sent via-email or by download. They monitor for anomalies and alert team management in those instances for human resolution.

Results:

This solution fully automates report creation and alerts for time and attendance. The team management's time on timecard validation is reduced to 0.233 FTEs. Automatic adjustments for daylight savings, holidays, times and overtime create a simple and productive system for the staff.
